

This stylesheet converts an OPML file into a YAML file meeting a sample schema. It is tailored for use in symfony projects, but the principle can be applied to other scenarios.

It was written by J Wynia ([www.wynia.org](http://www.wynia.org)). This file was generated on January 1, 2007.

This code is public domain. Do whatever you want with it.

```
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:output method="text" indent="no" standalone="no" omit-xml-declaration="yes" />
<xsl:template match="/">Feed:<xsl:for-each select="//outline">
  record_<xsl:value-of select="generate-id(.)"/>:
    URL: <xsl:value-of select="@xmlUrl"></xsl:value-of>
    htmlURL: <xsl:value-of select="@htmlurl"></xsl:value-of>
    title: <xsl:value-of select="@title"></xsl:value-of>
    description: <xsl:value-of select="@description"></xsl:value-of>
</xsl:for-each>
<xsl:apply-templates />
</xsl:template>
</xsl:stylesheet>
```
